CHIPS Technology Group LLC Expands Cloud Computing Offerings to Clients

Global Research Report Identifies The World's Most Progressive Managed Service Providers

SYOSSET, New York (May 7, 2010) – CHIPS Technology Group, a premier Information Technology (IT) business solutions provider, has expanded their Cloud Computing offerings and services to their small to medium sized clients. The cloud computing infrastructure consists of highly available and reliable services delivered through a dedicated data center. CHIPS uses their datacenter to host the critical components of their client's infrastructure in an offsite location.

CHIPS Cloud Computing solutions are meant to fill the gap for smaller companies who cannot afford the technology or the personnel necessary to build their own infrastructure, and don't have the breadth of needs that large providers like Amazon deliver. "Our cloud solution allows our clients to take advantage of the financial and technological advantages the Cloud Computer offers, while still receiving the same intimate level of support they expect from us. Knowing that their network is secure and efficient allows them to keep their focus on their business priorities", says David Tan, Chief Technology Officer of CHIPS.

CHIPS started building their data center about three years ago. There are many offerings that clients have the option to go with when deciding to move "into the cloud". They can choose to be fully hosted and have their entire infrastructure be held in the offsite datacenter. Many clients will keep only their non-business critical applications in the cloud. Some clients even choose to have only their e-mail application hosted. In the past 18 months, CHIPS has moved a significant number of clients into the cloud and has plans for more client moves in the near future.
